

Hermes Agent Quick-Start Config Pack

Technical documentation and setup instructions for deploying the Hermes Agent and configuring the Supabase Model Context Protocol (MCP) server.

1. Railway Deployment Guide

This section outlines the procedure for deploying the Hermes Agent to Railway infrastructure. The process has been streamlined to ensure a rapid and error-free setup.

Important Note: The deployment steps do not require a direct git repository link. Instead, you will use the pre-configured one-click Railway deployment template.

Step 1: Access the Deployment Template

To begin the deployment, navigate to the official one-click Railway deployment template found in the knowledge base file [Deploy Hermes Agent by Nous Research](#).

Hermes Agent by Nous Research

Step 2: Configure Environment Variables

Upon clicking the deployment link, Railway will initialize the `derekcheungsa/hermes-agent-template`. Before the deployment can finalize, you must provide the required environment variables to secure your agent instance.

You will be prompted to enter the following **2 required variables**:

- `ADMIN_USERNAME`: Define the administrator username for your Hermes Agent instance.
- `ADMIN_PASSWORD`: Define a strong, secure password for the administrator account.

Step 3: Execute Deployment

Once the variables are securely entered, confirm the deployment in the Railway dashboard. Railway will automatically provision the necessary infrastructure, build the container, and deploy your Hermes Agent.

2. Supabase MCP Server Setup Guide

The Model Context Protocol (MCP) allows your Hermes Agent to securely interface with your Supabase database. Follow this simple process to establish the connection.

Step 1: Obtain Your Supabase Access Token

Before configuring the MCP server, you must generate an authentication token from your Supabase account.

1. If you do not have an account, sign up or log in at the [Supabase Dashboard](#).
2. Create a new Supabase project if you haven't already.
3. Navigate to your account settings and generate a new Personal Access Token. Copy this token to a secure location, as it will be required in the next step.

Step 2: Add the MCP Server via Telegram

With your Supabase access token ready, you will now instruct your agent to connect to the Supabase MCP server using Telegram.

Open your Telegram interface connected to the Hermes Agent and send the following specific prompt, replacing `<supabase token>` with the actual token you generated in Step 1:

```
add mcp server knowledge base file https://mcp.supabase.com/mcp and <supabase token>
```

Once sent, the agent will process the command, authenticate using your provided token, and successfully integrate the Supabase MCP server into its context.
